FRONT RANGE PRECAST CONCRETE, INC.

FLXX® FIRE-FOE

Manufacturing - 2800 Gallon Cistern Pierced with 100 Tapered Perforations Can be Delivered All Across the Country

Installation - Excavation backfilled with clean river rock and lined with filter fabric reduces sand and other debris in the gallery. Visible here is the manhole access, dry hydrant, vent pipe, and the clean rock used in backfill.

Greetings Firefighter,
Front Range Precast Concrete, the developer of the FLXX Watertight Tank®, has developed an exciting innovation in wildland firefighting. We have developed a rural fire hydrant with a dependable water supply. The Fire-Foe™ provides 2,800 gallons of available water for use in an emergency. When tapped it immediately recharges with groundwater through one hundred uniform tappered perforations that surround it. Build time for the entrie proejct is only a few days. You can order, install, and have the FLXX® Fire Foe™ ready for use withing a week for a very reasonable price, and with the same quality of production that canbe expected from any of the FLXX product line.

Use - The gallery can be outfitted with a dry hydrant or a typical cast iron hydrant. We can meet your specifications.

The firefighters pumped at 500 gpm and 1000 gpm but were unable to lower the water level into the gallery itself.

The gallery, hydrant, and access cost $6,000 to $8,000 (depending on size and specifications).
